# 1 ER Diagram

Here is my ER diagram

## 2 Relational Database Schema

Here are my schema:

Process(process\_id,process\_data)  
Assemblies(assembly\_id,date\_ordered, assembly\_details)  
Manufacture(process\_id,assembly\_id)  
Customer(name,address, category)  
Order(name,assembly\_id)  
Department(dept\_num,dept\_data)  
Supervise(dept\_num,process\_id)  
Fit(process\_id, fit\_type)  
Paint(process\_id, paint\_type, painting\_method)  
Cut(process\_id,cutting\_type, machine\_type)  
Account(acct\_id, type, type\_id, date\_established, costs)  
Job(job\_num, job\_date.commenced, job\_completed)  
Assign(job\_num, assembly\_id,process\_id)  
Transaction(tran\_num, sup\_cost)  
Costs(job\_num,process\_id, tran\_num)  
Fit\_Job( job\_num, labor)  
Paint\_Job( job\_num,color,volume, labor)  
Cut\_Job( job\_num, machine\_type, time, material, labor)

## 3 Storage

### 3.1 Storage Structures

Table Name	Query Number and Type	Search Key	Query Frequency	Selected File Organization	Justification
Customer	1 Insertion	name	30/Day	heap on name	At the moment adding lots of data and not accessing it directly often
Department	2 Insertion	dept_num	infrequent	Sequential on dept_num	Since this data is added infrequently but referenced by other tables often, sequential insertion seems appropriate.
Process (and sub categories)	3 Insertion	process_id, (sub category info)	infrequent	Sequential on process_id (and sub category id)	Infrequent insertion but often called
Supervises	3 Insertion	process_id and dept_num	infrequent	Sequential on process_id	Infrequent insertion but called often on process_id
Orders	4 Insertion	name, assembly_id	40/Day	dynamic hash on name and ass_id	This is a lot of orders to create each day. These will need to be joined with other tables frequently as is happening in our insertion so it is important to be easily accessible
Manufacture	4 Insertion	assembly_id	40/Day (but each assembly may have many processes)	dynamic hash on assembly_id	Frequent insertion with joins on other tables
Account	5 Insertion	type_acct and num  4	10/Day	Multitable clustering with type_acct for clustering and num sequential	This structure will make for fast access later and there is a fair amount of additions here.

Table Name	Query Number and Type	Search Key	Query Frequency	Selected File Organization	Justification
Job	6 Insertion	job_num	50/day	B tree on job_num	B tree is appropriate for often inserted and often called index.
Job	7 Random Search (Insertion of job_date_end)	job_num	50/Day	<i>B</i> tree on job_num	To enter completion data, you'll need a random search on job_num. <i>B</i> tree will be an efficient storage for all these records
Transaction and Costs	8 Random Search	tran_no for Transaction and tran_num, process_id for Costs	50/day	B tree on the tran_no and process_id	We'll need to update a lot of accounts here so it will be important to get to them quickly
Account	9 Random Search	type = Assembly and num	200/day	B tree on num	We have previously done clustering on these attributes so this will require nothing additional to the file
Job	10 Range Search	job_date_completed and job_date_completed	20/day	Sequential index on both dates	Frequent call. If put in order can retrieve data faster
Manufacture	11 Random Search	assembly_id	100/day	Sequential index on assembly_id	This index was already created for Query 4.
Customer	12 Range Search	name (in order) by category	100/Day	Multitable Clustering with category for clustering and name stored in a $B^+$ tree	Since this data is accessed often this table should be pre-built. New customers are added often so $B^+$ tree storage on name will be most efficient within this multitable
Cut_Job	13 Range Search	job_num	1/Month	Sequential Index on job_num	Since we are doing a range search, we would like these to be in order.
Paint_Job	14 Random Search	job_num 5	1/Week	Dynamic Hash function on job_num	since we are accessing occasionally but adding lots of jobs, it would be nice to have quick access via a hash.

### 3.2 Storage Structures on Azure

Info on Azure indexing can be found [here](#). Implementing these was a challenge. Azure uses B trees by default on the primary keys. This is great for random search but not so great for range searches. Since we knew this there were a few indexes that were unnecessary to create. Most of the rest were created especially if there were two attributes that were being indexed together. Sequential indexes (for range sort) were done by adding the ASC or DES tag to the attribute in question. Each index was created and added to the SQL code creating the tables necessary for indexing. The language in the MS documentation is not the most user friendly. I find this very often when dealing with their products. I wonder if this is a way to sell the SAS products that they now offer. Open source is my jam. Hope you like L<sup>A</sup>T<sub>E</sub>X assignments I created.

## 4 SQL and Azure

I have included my SQL file that creates the tables and indexes. Some comments appear to run off the right side of the paper, the full document has been included for completeness.

```
-- While working on the database design, it's useful to start from scratch every time
-- Hence, we drop tables in reverse order they are created (so the foreign keyconstra

## 5 SQL and Java

### 5.1 SQL Transact

I put the transact calls in a new SQL file included below.

```
GO
DROP PROCEDURE IF EXISTS query1 --get rid of the procedure if you built it before

GO
CREATE PROCEDURE query1 --this is the first.  Need three inputs
    @name1 VARCHAR(64),
    @address VARCHAR(64),
    @category NUMERIC(2,0)
AS
BEGIN
    INSERT INTO Customer VALUES (@name1, @address, @category) --insert me now
END
GO
--EXEC query1 @name = 'Nick', @address = NULL, @category = 10
GO

GO
DROP PROCEDURE IF EXISTS query2 --get rid of the procedure if you built it before

GO
CREATE PROCEDURE query2
    @dept_num INT,
    @dept_data VARCHAR(128)
AS
BEGIN
    INSERT INTO Department VALUES (@dept_num, @dept_data) --insert me now
END
GO
--EXEC query2 @dept_num = 1, @dept_data = NULL
GO
DROP PROCEDURE IF EXISTS query3 --get rid of the procedure if you built it before

GO
CREATE PROCEDURE query3 --this is the first.  Need three inputs
    @process_id INT,
```

```

        @process_data VARCHAR(64),
        @type VARCHAR(5),
        @type_type VARCHAR(64),
        @type_method VARCHAR(64)
AS
BEGIN
    SET XACT_ABORT ON
    BEGIN TRANSACTION
        INSERT INTO Processes VALUES (@process_id, @process_data) --insert into proce
        IF @type = 'Fit' INSERT INTO Fit VALUES (@process_id, @type_type)
        IF @type = 'Paint' INSERT INTO Paint VALUES (@process_id, @type_type, @type_m
        IF @type = 'Cut' INSERT INTO Cut VALUES(@process_id, @type_type, @type_method
    COMMIT TRANSACTION
END
GO
--EXEC query3 1,','', 'Fit', NULL, NULL
GO
DROP PROCEDURE IF EXISTS query4 --get rid of the procedure if you built it before

GO
CREATE PROCEDURE query4 --create assembly with all associated processes for customer
    @assembly_id INT,
    @date_ordered DATE,

## 6 Java Execution

### 6.1 Query 1

```
project [Java Application] C:\Users\njacob\p2\pool\plugins\org.eclipse.justj.openjdk.hotspot.jre.full\jre\bin\java.exe
Welcome to my application!

Please select one of the options below:
1) Enter a new customer;
2) Enter a new department;
3) Enter a new process;
4) Enter a new assembly;
5) Create a new account;
6) Enter a new job;
7) Complete a job;
8) Update costs;
9) Print cost on assembly id;
10) Print labor time by department;
11) Print assembly details;
12) Print customers by category;
13) Delete cut jobs;
14) Change color;
15) Import new customers;
16) Export customers by category;
17) Exit!

- 17) Exit!

17  
Exiting! Good-bye!

## 7 Web Database

### 7.1 Source Code

#### Data Handler

```
package jsp_azure_test;

import java.sql.Connection;
import java.sql.ResultSet;
import java.sql.SQLException;
import java.sql.DriverManager;
import java.sql.PreparedStatement;

public class DataHandler {

    private Connection conn;

    // Azure SQL connection credentials
    final static String server = "jaco0121-sql-server.database.windows.net";
    final static String database = "cs-dsa-4513-sql-db";
    final static String username = "njjacob";
    final static String password = "";

    // Resulting connection string
    final private String url =
        String.format("jdbc:sqlserver://%s:1433;database=%s;user=%s;password=%s;e
            server, database, username, password);

    // Initialize and save the database connection

    private void getDBConnection() throws SQLException {
        if (conn != null) {
            return;
        }

        this.conn = DriverManager.getConnection(url);
    }

    // Add a customer to the table
```

```

    public boolean addCustomer(
        String cname, String address, int category) throws SQLException {

        getDBConnection(); // Prepare the database connection

        // Prepare the SQL statement
        final String sqlQuery =
            "INSERT INTO Customer " +
            "(name, address, category) " +
            "VALUES " +
            "(?, ?, ?)";
        final PreparedStatement stmt = conn.prepareStatement(sqlQuery);

        // Replace the '?' in the above statement with the given attribute values
        stmt.setString(1, cname);
        stmt.setString(2, address);
        stmt.setInt(3, category);

        // Execute the query, if only one record is updated, then we indicate success
        return stmt.executeUpdate() == 1;
    }

    // Return the result of selecting all customers based on category
    public ResultSet getAllCustomers(int category) throws SQLException {
        getDBConnection();

        final String sqlQuery = "SELECT * FROM Customer WHERE category = ?";
        final PreparedStatement stmt = conn.prepareStatement(sqlQuery);
        stmt.setInt(1, category);

        return stmt.executeQuery();
    }
}

```

#### **Add customer**
